STUDENT EXPLORATION GUIDE

Wildlife Detective Lab

Explore wildlife. Test AI. Think like a scientist.

Camera-trap photo: NPS / public domain.

Scan to open the lab

Use your phone's camera.
No account or installation needed.

Camera traps photograph animals day and night, helping scientists study wildlife and protect habitats. They produce more pictures than people can quickly review. Computer vision helps sort that evidence, but people still need to check what AI finds.

EXPLORE THREE TABS

1 How computer vision works

Explore camera traps, pixels, patterns, and training. Watch a small classroom model predict, measure error, and adjust its weights using real animal photos.

2 Detective lab

Choose an included photo or upload a permitted one. MegaDetector finds possible animals, people, and vehicles. Select an animal crop; SpeciesNet suggests its species. Compare the result with what you see.

3 Questions & investigations

Explore common questions and test the answers with interactive examples.

Your detective challenges

1. Predict what the AI will find before revealing its result.
2. Add blur, darkness, or fewer pixels. What changes?
3. Find a mistake or uncertain result. What evidence supports your judgment?

Uploads are processed on Google Cloud; the app does not save photo files.
First live classification may take 1-2 minutes. AI scores are clues, not proof.
